*Rand article from wiki

The moving images of a film are created by photographing actual scenes with a motion-picture camera, by photographing drawings or miniature models using traditional animation techniques, by means of CGI and computer animation, or by a combination of some or all of these techniques, and other visual effects. Before the introduction of digital production, film was a physical strip of film consisting of a series of static or still images of live action photographed at the rate of 24 frames or images per second. When the images are viewed at the same rate the

illusion of motion is the result of what is called persistence of vision, the fact that the mind cannot process individual images at that speed, so the images merge together to produce the illusion of motion within the image. If the film is an animation of any kind, the widely separated in time images are planned to be seen at the standard speed.

Technology See also: Cinematic techniques Film stock consists of transparent celluloid, acetate, or polyester base coated with an emulsion containing light-sensitive chemicals. Cellulose nitrate was the first type of film base used to record motion pictures, but due to its flammability was eventually replaced by safer materials. Stock widths and the film format for images on the reel have had a rich history, though most large commercial films are still shot on and distributed to theaters as 35 mm prints. Originally moving picture film was shot and projected at various speeds using hand-cranked cameras and projectors though 1000 frames per minute. frames is generally cited as a standard silent speed, research indicates most films were shot between 16 frames and 23 frames and projected from 18 frames on up often reels included instructions on how fast each scene should be shown.¹³ When sound film was introduced in the late 1920s, a constant speed was required for the sound head. 24 frames per second were chosen because it was the slowest and thus cheapest speed which allowed for sufficient sound quality.citation needed Improvements since the late 19th century include the mechanization of cameras - allowing them to record at a consistent speed, quiet camera design - allowing sound recorded on-set to be usable without requiring large blimps to encase the camera, the invention of

more sophisticated filmstocks and lenses, allowing directors to film in increasingly dim conditions, and the development of synchronized sound, allowing sound to be recorded at exactly the same speed as its corresponding action. The soundtrack can be recorded separately from shooting the film, but for live-action pictures, many parts of the soundtrack are usually recorded simultaneously.

The Chinese film industry had lost US billion by March 2020, having closed all its cinemas during the Lunar New Year period that sustains the industry across Asia.² North America saw its lowest box office weekend since 1998 between March 13–15.³ *Demon Slayer: Mugen Train*, the highest-grossing film of 2020, earned 3 million worldwide.⁴ It was the first time since 2007 that the top-grossing film of a given year had earned less than billion and the first time a non-American film was the top-grossing film of the year.⁵
